Egg weighing procedure and egg weight chart

✓ Start as from 5 - 10% daily lay. Weigh the eggs of the second egg collection of the day.

✓ Remove double yolks, very small and abnormal eggs (shell defects, misshapen).

✓ Weigh at least 120 eggs per house per day during the onset of lay and then 2 times per week. Do not forget to tare empty trays.

✓ Ensure the total weight of all eggs is within the capacity of the scale.

✓ Analysis of the results:

▢ An underfed flock will have a poor development of egg weight.

▢ If no egg weight increase is observed over 3 to 4 days at the start of lay then be prepared to advance the next feed increase.
